

The latest solution in mobile telecommunication security

Do you feel secure while talking on your mobile phone?

Today many confidential conversations and important decisions are made on-the-move while talking on your mobile phone. At the same time interception and call-ID spoofing are becoming more simple and the necessary equipment is becoming less expensive. The encryption standard A5/1 which is used by almost all GSM operators for securing the calls executed in their network is a technology created before 20 years. Nowadays every single telephone call can be intercepted using a laptop, mobile phone and antenna, which can be bought in every store selling electronics. In addition the software needed for all of the above is available on the internet for free.

Secuvoice is the solution that will guarantee your secure mobile communication

What is Secuvoice?

Secuvoice is a hardware based solution that encrypts the call and authenticates the identity of the user by a special encapsulated encrypting microprocessor, which is integrated into a micro SD memory card. This modified card is placed into the mobile phone just like your normal SD memory card. Secuvoice uses a special encryption technology, developed by the German Federal service for information security for use in the government sector. Unlike the widely spread software encryption solutions, where the software is installed directly on the phone's operation system, Secuvoice is a separate hardware component, which eliminates the possibility of breach. Furthermore the sound quality can be compared to the quality of a normal phone call and it does not reflect on the battery resources, which is a great problem with the software-based solutions.

Secuvoice target group

Secuvoice is meant to be used by managers and high-level executives of companies, who work with confidential information. No matter if it refers to industrial espionage, confidential information or a state secret, the security of the communication is of great importance.

How to use Secuvoice?

The micro SD card should be inserted into your mobile device just like an ordinary memory card, the software of the card will be installed automatically, and the user enters his PIN code through which he identifies himself every time when he makes a secure call. This call can be decrypted only if the interlocutor has a Secuvoice Micro SD card and by entering his personal PIN code allows the call to be carried out. In addition Secuvoice does not leave any footprint on the memory of your phone. All the sensitive data like your secure contacts and your call history are stored on the Secusmart security card and are absolutely secure. If you decide to take out the card from your phone, as soon as you insert it in any other phone and enter your personal PIN code you will have access to all the information.

Official distributor for Bulgaria of Secuvoice is Telecom Business Solutions LTD

Telecom Business Solutions Ltd. is a company founded in the year of 2006 as an authorized reseller of telecommunication equipment Astra (Ericsson) for Bulgaria.
